

Eric Martin

Revenue Operations & Technical Systems Leader

Newton, KS | (316) 250-8333 | ericm93.2023@outlook.com | eric-portfolio-five.vercel.app

Operator-technical leader who builds the operating systems behind revenue growth, customer acquisition, field execution, forecasting, and owner visibility. Combines business development, RevOps, workflow architecture, and hands-on software delivery to turn scattered work into usable systems: queues, dashboards, approvals, automations, reporting layers, and adoption rhythms that teams actually run. Background spans growth-stage operations, customer-facing delivery, internal tools, SaaS-style product demos, and production software environments with live users and uptime expectations.

CORE STRENGTHS

Revenue Operations | Strategic Operations | Customer Acquisition | Revenue Recovery | Forecasting & Pipeline Visibility | Business Process Architecture | Cross-Functional Leadership | GTM Execution | Opportunity Modeling | Executive Reporting | Workflow Standardization | Internal Tooling | Human-in-the-Loop AI Workflows | Queue & Approval Design | Implementation Planning | Vendor Coordination | Field Operations Systems | Technical Solutioning | Owner Visibility | Rollout & Adoption

TECHNICAL STACK

JavaScript/TypeScript | React | Next.js | Node.js | Python | C#/.NET | SQL/PostgreSQL | Supabase/Postgres/RLS | API route handlers | PWAs | Apps Script | Dexie/IndexedDB | Chart.js/Recharts | React Query | Zod | Playwright | Vitest | GitHub CI/CD | Vercel | Railway | OpenAI/API Gateway | MCP integrations | OCR/vision workflows | dashboarding and reporting logic

PROFESSIONAL EXPERIENCE

Director of Business Development & Technical Systems | Kansas Electric, Inc. | Oct 2024 - Dec 2025 | Newton, KS

- Built a business development and technical systems motion tied to \$100M+ in 2025 presented opportunities and a forward-looking opportunity pipeline exceeding \$200M over the following 24 months.
- Designed and shipped internal systems across CRM, estimating, field reporting, scheduling, forecasting, customer intelligence, and leadership visibility, reducing reliance on scattered sheets, inboxes, and ad hoc handoffs.
- Rebuilt the company website, service positioning, and lead capture flow to create a more credible public presence and cleaner intake path from initial interest to internal follow-up.
- Built CRM and activity workflows with offline-capable PWA patterns, indexed local storage, dashboard views, AI briefing/summarization, and integration concepts for Acumatica touch tracking.
- Developed field reporting and estimating tools, including offline capture, guided video prompts, AI parsing into structured summaries, RFP/takeoff extraction concepts, OCR fallback, confidence scoring, and export-ready outputs.
- Standardized forecasting, pipeline rollups, opportunity refresh workflows, labor planning summaries, and customer research capture so leadership could see commercial activity, delivery readiness, and operational risk in one operating picture.

Head of Strategic Operations | Vale Field Services | Jul 2019 - Oct 2024 | Remote

- Helped scale the company from startup stage to approximately \$4M annually by building the processes, standards, vendor networks, training, QA, and execution infrastructure required for repeatable growth.
- Owned operating frameworks across planning, customer coordination, vendor/subcontractor management, documentation, dispatch, field execution, issue resolution, and post-work quality follow-through.
- Acted as a strategic pre-deployment partner for customers by identifying feasibility concerns, installation risks, support requirements, site-readiness gaps, and best-fit execution models before rollout.
- Coordinated distributed teams, vendors, customers, and internal stakeholders across multi-site deployment work for restaurant, commercial, technology, and facilities programs.
- Created repeatable operating rhythms, documentation standards, escalation paths, and support structures that improved consistency across complex, geographically distributed work.

SELECTED SYSTEMS & PRODUCT WORK

Atlas-Beren Console - Internal operator control plane for managed AI workflow systems

- Built a Next.js 16 / React 19 / TypeScript / Supabase system for client workspaces, agent catalog metadata, readiness gates, evidence review, approvals, integration health, prospecting, action tracking, and weekly visibility.
- Designed governance around human approval, role-gated access, mock/live run separation, audit trails, readiness overrides, and value/risk guardrails before external actions could ship.

Kansas Electric Systems - Revenue and operations infrastructure

- Built a connected business app suite spanning CRM Console, Field Reports, Estimate Accelerator, Opportunity Radar, Smart Contacts, Labor Planner, BD Forecast, and Customer Intel.
- Implemented practical architecture choices for a small team: offline-first PWAs, Apps Script and Sheets backends, indexed local storage, service worker caching, AI parsing/summarization, scheduled refreshes, structured schemas, and GitHub CI/CD.

FreightFlow AI - Freight-focused shipper prospecting and SRM workspace

- Built a Next.js / React / TypeScript / Supabase workspace combining shipper discovery, AI-assisted account briefs, public contact research, geographic prospecting, and shared pipeline movement for brokerage sales teams.
- Designed the workflow around actual freight sales behavior: strong freight signals, area-based calling, public contact paths, nearby prospect clustering, and a lightweight relationship pipeline instead of a generic CRM.

LeakLens - Enterprise-style AI revenue leak recovery SaaS demo

- Built a Next.js 16 / TypeScript SaaS demo with a marketing funnel, authenticated dashboard, connector management, leak triage, recovery workflows, report generation, typed mock APIs, React Query/Zod validation, UX polish, and Playwright smoke tests.

Eden MMO Engineering - Production software and live-ops engineering

- Built and supported live MMO systems in C#.NET, JavaScript, and PostgreSQL for a community of approximately 30,000 players, with persistent user state, performance constraints, incident response, hotfixes, operational tooling, logging, and abuse mitigation.
- Owned production systems end-to-end, including server-side feature delivery, data modeling, support/moderation tooling, performance improvements, safe migrations, and release risk management.

OPERATING PRINCIPLES

Start from the signal flow, not the buzzword. Define ownership before automation. Build for operators, not just demos. Keep review points where judgment matters. Stay accountable through rollout, adoption, support, and the messy reality after launch.
